Analytical Reference Standards and Supplemental Data for
Pesticides and Other Organic Compounds,

Dec 30,

Morton Beroza, and Robert L. Caswell.

PERFORMER: Health Effects Research Lab., Research Triangle
Park, NC. Analytical Chemistry Branch.
EPA-600/2-81-011

See also report dated May 78, PB-284 224.

Contents: List of available pesticide standards and ordering
information; Compounds deleted from 1973 stock and name
changes; List of non-pesticide organic chemical standards;
Safe handling of primary reference standards; Preparation
and storage of reference standards; Decoding residue
analytical method references; List of contributing pesticide
producing companies; Index of pesticide equivalent names;
Mailing list confirmation; Availability of analytical
reference standards.

KEYWORDS: *Pesticides, *Organic compounds, *Standard
reference materials.

DISCLAIMER

This report has been reviewed by the Health Effects Research Laboratory, U.S. Environmental Protection Agency, and approved for publication. Mention of trade names or commercial products does not constitute endorsement or recommendation for use.

PREFACE

The reference standards repository of the Health Effects Research Laboratory was originally established in 1965 at the Perrine, Florida facility then known as the Pesticides Research Laboratory of the U.S. Public Health Service. The repository was created as a central source of high purity pesticide reference standards available only to in-house scientists and laboratories in the field conducting area or "community" monitoring of pesticides in human specimens under contract with the Public Health Service.

During ensuing years at Perrine and more recently at Research Triangle Park, N.C., the laboratory now known as the Environmental Toxicology Division of the EPA Health Effects Research Laboratory, has extended its service to other non-profit pesticide research and monitoring laboratories on a discretionary basis as time and resources have permitted.

In Section I, a the current Index lists 450 pesticidal and related compounds. Seventeen compounds listed in the 1978 Index have been deleted because (1) there has been no demand; (2) they are either no longer produced, or (3) they have proved too difficult to obtain. On the other hand, 29 new pesticidal compounds and/or derivatives have been added to the stock.

Section II contains organic compounds other than pesticides. The majority of these compounds are listed in the 1974 TOXIC SUBSTANCES LIST published by the National Institute for Occupational Safety and Health, and many of them have been detected in monitoring programs of the nation's waterways. The decision to stock these compounds was based on the fact that many monitoring laboratories are now interested in a wide spectrum of toxic organic pollutants. In this edition, 20 new organic compounds have been added. A listing of the compounds in Section II by chemical name and synonym is given in Section II.

Residue methodology citations have been updated, deleting some of the older citations and incorporating newer ones. As in the 1978 edition, references are given in code in the faceplate for each compound in Sections I, a and II, with decoding information provided in Section V. The validity or integrity of the analytical data in the cited publications is neither recommended nor endorsed. The data are provided only for supplemental information.

A special note of appreciation is extended to those commercial producers of pesticidal compounds who provide analytical grade reference standard materials. Without their help, it would be next to impossible to maintain the repository service. Contributing companies are shown in Section VI.

Continuing with the policy instituted in the 1973 edition of this Index, supplemental data such as USE, CHEMICAL NAME, MOLECULAR WEIGHT, EMPIRICAL AND STRUCTURAL FORMULAE and TOXICITY are given for each compound whenever data were available. Chemical Abstract Registry Numbers (CA Reg. No.) have been added in this edition. Unless otherwise stated, toxicity is expressed as the LD₅₀ based on oral feeding of male rats. The figure given is the number of milligrams of the compounds required per kilogram of animal weight to produce mortality in 50% of test animals. Thus the lower the figure, the higher the toxicity. All users are strongly advised to exercise extreme care in the handling of any compound with an LD₅₀ of 50 or below. A number of these highly toxic compounds are also dermally toxic, and scrupulous care must be taken to avoid contact with the skin (see Section III).

In Section I, a each compound is listed in capital letters by its common name, if one has been assigned. Also shown parenthetically is any other name by which the compound is or has been widely known in the marketplace. In cases where no common name has been assigned, a trade or proprietary name is used. For the convenience of the reader, Section VII contains a list of other pesticide names along with assigned common names where an assignment has been made. If a common name has not been assigned, the most widely known trade name is used. The omission of any proprietary name does not imply endorsement of one product over another. The subject of compound names is complex and subject to rapid change.

Section I,a

LIST OF AVAILABLE PESTICIDE STANDARDS AND ORDERING INFORMATION

Each compound listed in the following pages is currently available and can be supplied in 50-mg portions. However, during the two-year life of this edition, the production of certain compounds may be discontinued, and reference standard materials will no longer be available. Requesters will be notified when standards are no longer available or are temporarily out-of-stock.

For the reader's convenience all compounds are listed alphabetically by common name with code numbers on the next three pages so that the entire stock may be scanned quickly. In ensuing pages each compound is listed and data such as chemical name, formulae, toxicity, CA Registry No., etc., are given. An index of pesticide equivalent names (Section VII) is included to facilitate finding the name under which each pesticide is listed.

The percentage purity or assay value is printed on the sample bottle. A few compounds are available only as a formulation, and expectedly the assay value will be relatively low, in the order of 40-50% active ingredient. It will also be observed that certain compounds have "adjusted" or "stabilized" purity values. This means that because of the instability of the particular compound at extremely high concentration levels, this level has been purposely reduced to achieve a more stable standard.

Wherever the symbol = is used at the end of a line in the typing of the chemical name, it means that the word in the first portion of the next line is a continuing part of the word at the end of the line above. An ordinary hyphen at the end of a line indicates that the hyphen is a normal part of the chemical name.

Reference standards are intended for the use of laboratories which are included in the following categories: state and municipal, U.S. Federal Government, foreign government, and college and university. Private laboratories are also eligible to receive standards if they have a government contract (federal, state, or local) which necessitates the use of these materials. Private laboratory requesters should complete and return the form in Section IX along with their first request.

Our service is intended solely to provide analytical reference standards. Because of great demand and limited supplies, the amount of each standard is restricted to no more than 50 milligrams. Researchers needing larger quantities, such as for animal feeding studies, should contact the manufacturer or purchase from a commercial supplier. We cannot supply large quantities.

Most of the high-purity analytical standard compounds are difficult to prepare and therefore in short supply. We suggest that not more than 20 mg of primary standard be weighed out and diluted to 100 ml with an appropriate solvent. This yields a concentration of 200 µg per ml and should provide a

sufficiently high concentration for just about any gas-liquid or thin layer chromatographic method. In fact, a solution of this concentration should require one or more serial dilutions to provide an appropriate concentration for most electron-capture GC work.

Occasionally we hear that bottles of standards are received empty. There is a remote possibility that this may be the case, but generally the bottle only appears to be empty from the outside. Some of the colorless, highly viscous liquids may coat the interior of the bottle or collect inside the bottle cap. When a bottle is received that appears empty, the cap should be carefully removed and the interior of the bottle and cap examined.

In preparing requests for standards, each compound needed should be listed by code number and common name to assist repository personnel in processing requests. An Advice of Receipt card and a sample request form are enclosed with each shipment. It is important that the card be mailed back immediately. This provides our only verification that each shipment has reached its destination. When these mail-back cards do not return within a month, a tracer is mailed to the requester. No covering letter is required with the request form, but a full address must be given along with requester's name.

Requests are occasionally received for compounds that are not given in the Index. They may have been stocked at the time of the previous edition or the requester may be overly optimistic and assumes they can be caused to materialize. If any compound is not listed, it is not available from the repository.

ORDERING INFORMATION

All requests for standards should be directed to:

Quality Assurance Section
Analytical Chemistry Branch, ETD/HERL (MD-69)
U.S. Environmental Protection Agency
Research Triangle Park, N.C. 27711

(Please use the
entire address)

Requests for standards by scientists associated with university laboratories must be made on stationery bearing the letterhead of the institution and must be signed by a university official such as a department head. Pesticides will not be mailed to individuals submitting requests on personal stationery.

Because of greatly increased demand for standard materials and limited assistance available, the repository will no longer accept telephone orders except in response to emergency requests. The commercial number is (919) 541-3951; the Federal tele-communications system (FTS) is 629-3951. These numbers are to be used only for requesting standard materials. Questions concerning the repository operation, availability of manuals, or other quality assurance programs should be directed to the above address or commercial phone (919) 541-2564. The FTS number is 629-2564.

Section I,b

COMPOUNDS DELETED FROM 1978 STOCK AND NAME CHANGES

All compounds in the repository stock are reviewed biennially to determine if they should be continued. Compounds are deleted if manufacturing is discontinued or if, during a two-year period, we receive no requests for a given compound.

The following compounds listed in our 1978 Index have been deleted in this edition for one of the above reasons:

Bromophenoxime	Glyoxime
Chlordene, Beta	Kinoprene
Cisanilide	Menazon
Clonitralid	Methoxychlor (Tech)
Cycloprate	Phenkapton
Cyperquat Chloride	2,3,6-TBA
Dichloropropene-trans	TEPP
Dimethametryn	Terbuthiuron
Fluoridamid	

The following compounds are listed by a different name from the one given in our 1978 edition. This may be due to a common name being established or to the old name being replaced.

Folex to Merphos
Jodenphos to Iodofenphos
Krenite to Fosamine Ammonium
Methomyl Oxime to Oximino methomyl
Oxamyl Oxime to Oximino Oxamyl
Penoxalin to Pendimethalin
Velpar to Hexazinone

Section II

LIST OF NON-PESTICIDE ORGANIC CHEMICAL STANDARDS

In 1978 the repository stock was expanded to include additional non-pesticide organic compounds. These will be provided on request to qualified laboratories in samples of no more than 200 milligrams. With this edition, 20 additional compounds are being offered.

The majority of these compounds are designated as toxic and are included in the TOXIC SUBSTANCES LIST published by NIOSH in 1974. Many of them were also included in the list of 113 "Consent Decree Compounds" specified by the U.S. EPA in 1977 as compounds that constitute an appreciable health hazard to man and animals and which are to be monitored in industrial effluents.

Special safety precautions should be taken in the handling and analysis of these compounds. A number of them are known or suspected carcinogens and, therefore, must be handled accordingly.

In the supplemental data supplied for each compound, the terms "Industry Source" and "Hazard" require a brief explanation: "Industry Source" refers to the type of industry whose effluent has been monitored by EPA, and a specific compound has been identified by analysis. "Hazard" provides information to the analyst concerning the potential danger in the handling of the compound. Where these spaces show "No Data," it is meant that none could be located in our search. Toxicity data were available for many compounds but were unavailable for some.

Because of shipping restrictions, this group of compounds is available only to laboratories on the North American continent where surface carriers may be utilized.

For the reader's convenience, the compounds are listed alphabetically by common name with code numbers on the following page. Some equivalent names are included in the Index to designate the common name under which each is listed.

ALPHABETICAL LISTING AND CODE NUMBERS OF NON-PESTICIDE ORGANIC COMPOUNDS

Section III

SAFE HANDLING OF PRIMARY REFERENCE STANDARDS

Personnel handling pesticide and other highly toxic organic standards should be well trained so as to be fully aware of the health hazards involved. Many pesticides are extremely toxic and some are suspected as being carcinogenic as well.

Extreme caution must be exercised while handling many organo-phosphorous pesticides. They are highly toxic, not only by oral ingestion, but dermally and by inhalation. Disposable plastic gloves should be worn at all times during the handling of the primary standard. Except for the time required for weighing at the analytical balance, all handling of the standard should be carried out in an exhaust hood to minimize inhalation of vapor. If, in spite of all precautions, primary standard should get on the skin, thorough washing with copious amounts of soap and water should be carried out immediately. The accident should also be reported to supervisory personnel and a physician consulted at once. Delayed toxic effects are characteristic of many pesticides, and reporting of exposure is essential.

Section IV

PREPARATION AND STORAGE OF REFERENCE STANDARDS

"The greatest single source of quantitative error in GC Analysis is undoubtedly inaccurate standard solutions" (Quote from EPA Quality Control Manual)

A. STORAGE OF PRIMARY STANDARDS:

Proper storage of reference standards is an essential part of the analytical process. Studies have shown that standards that are not in solution are generally stable to chemical decomposition for at least one year, if kept refrigerated or frozen. The generally used organochlorine, organophosphate, triazine, and carbamate compounds are included in this group. The organophosphate and carbamate standards are susceptible to hydrolysis and should therefore be stored in a refrigerated container.

Small sample bottles should be stored in a refrigerator within an air-tight container. A cabinet-type desiccator with an inch of indicating silica gel at the bottom is very satisfactory, providing both isolation and a dry atmosphere. Laboratories with limited refrigerator space may substitute large, wide-mouth glass jars (such as wholesale pack mayonnaise jars) with silica gel in the bottom and a hand-fashioned 1/4-inch-mesh platform just above the gel to hold the bottles of standards.

When a container is removed from the refrigerator, it should be allowed to come to room temperature before opening. The bottle caps should remain off only long enough to withdraw the sample, and the weighing should be rapid. After weighing, the bottle should be returned to storage immediately.

B. EQUIPMENT AND SOLVENTS:

1. Analytical balance capable of an accuracy ± 0.05 mg.
2. Spatula, stainless steel.
3. Pipets, Pasteur, disposable.
4. Flasks, volumetric, 25, 50, and 100 ml.
5. Bottles, prescription, 1/2 oz, 1 oz, or 2 oz, with plastic screw caps. Available from many wholesale pharmacy supply firms. Equip bottles with Teflon cap liners, sizes 13, 15, 18, and 22 mm, Arthur H. Thomas 2390-H22, H32, H42, and H62.

6. Serum bottle, 20-100 ml size, Wheaton #223742 to #223747, with Teflon-faced septa #224168 and seal #224183.
7. Refrigerator, explosion proof, with freezer across top, capable of maintaining $+4^{\circ}\text{C}$ in refrigerator section and -15°C in freezer.

NOTE: It is definitely preferable to have separate refrigerators for chemicals and sample materials. However, if a laboratory is restricted to one refrigerator, sample materials should be stored in air-tight glass containers to prevent contamination by spillage or airborne vapors from pesticides.

8. Toluene, isooctane (2,2,4-trimethylpentane), ethyl acetate, or hexane, pesticide quality, distilled in glass.

NOTES: 1. Toluene and isooctane are suitable solvents for most pesticide standards. Isooctane will not dissolve as many compounds as toluene but is preferred and used when possible since it does not affect Florisil elutions and is also much more compatible with electron capture detectors.

2. Isooctane or hexane are both suitable for standard dilution. Isooctane, while more expensive, offers the advantage of a much lower vapor pressure than hexane. Thus, the solvent is much less likely to evaporate through the seal in long-term storage and during repeated bottle openings.

3. Ethyl acetate is not recommended as a final solvent for electron capture GC but may be necessary for preparation of the first or concentrated "stock" solution of polar materials.

C. PROCEDURES:

1. Preparation of Concentrated "Stock" Standard Solutions.

NOTE: ALL HANDLING OF PESTICIDE STANDARDS SHOULD BE DONE WITH RUBBER GLOVES. SKIN CONTACT BY HIGHLY CONCENTRATED MATERIALS CAN BE FATAL. (At the same time, care must be taken to ensure that solvents do not contact gloves and thereby contaminate solutions.)

Except in special instances, a concentration of 200 $\mu\text{g/ml}$ is suitable as a first dilution for the common chlorinated and organophosphate pesticides. Ten milligrams of the primary standard, corrected to 100% purity, diluted to 50 ml will provide this concentration (20 $\text{mg}/100\text{ ml}$).

NOTE: Extreme care must be used in formulating the concentrated stock standard. An error made in its preparation will cause all subsequent dilutions for the life of the standard to be inaccurate, and all quantitations of samples based on the standard will be similarly incorrect.

2. Preparation of Standard Solutions of Intermediate Concentration.

Standard solutions of intermediate concentration are prepared because dilution of the concentrated stock to the final working standard is generally too great to achieve in one step. (Exceptions are a few of the less responsive compounds.) Convenient intermediate concentrations of a number of the more common pesticides are given in Table 1.

NOTE: Under no circumstances should a chromatographic injection syringe be used to dilute the concentrated stock solution to the final working standard. The chance for error is greatly increased by this technique.

3. Preparation and Handling of Working Standards.

The intermediate standard solution is diluted in a 50 ml or larger volumetric flask to obtain the final working standard solution. Table 2 is useful for rapidly determining the aliquot volumes of the higher-concentration solutions required to give specified concentrations of diluted working standards.

The selection of working standard containers and methods of handling and storage are, to some extent, a matter of local preference. Two procedures follow:

- a. Working standard mixtures, after dilution in volumetric flasks, are transferred to prescription bottles with Teflon-lined screw caps or serum vials. The mixtures are stored in the refrigerator when not in actual use.
- b. Working standard mixtures are transferred from the volumetric flasks into several small-volume (up to 20 ml) containers. The standard solutions are kept in the deep freeze (for a maximum of six months) and removed only for withdrawal of a sample. If the opened standard has noticeably evaporated, a new standard, obtained from the deep freeze, is used. This option has the advantages of requiring formulation of working standards less frequently and reducing the possibility of errors arising from repeated opening of a single working standard container.

NOTE: All standards should be replaced when significant solvent evaporation becomes apparent generally by comparing the liquid level with a reference line on the container.

D. CONTAINERS FOR STANDARD SOLUTIONS:

Volumetric flasks are, of course, the recommended glassware for preparation of all standard solutions. However, these containers are not used for storage primarily for the following reasons:

1. An inordinate amount of valuable refrigerator space is required for the storage of any significant number of volumetric flasks.
2. A large quantity of expensive volumetric glassware is required and therefore is not available for other uses.
3. The standard taper glass stopper does not form a good seal. The only way to reduce the effect of evaporation is to store a large volume of the standard, thereby reducing the relative solvent loss.

Prescription bottles with Teflon seals in the cap are much better containers; they are reliable and inexpensive. A mark on the side of the bottle or a piece of label tape at the liquid level can be used to monitor evaporation of the solvent. The standard is discarded when solvent loss becomes apparent. The serum bottle (with Teflon-faced cap) sold by Wheaton is another very good container. It allows a minimum of solvent evaporation when closed and is never opened in use. These features reduce solvent loss dramatically. Again, a mark or label on the side of the container at solvent level will help determine when the standard should be discarded.

E. GENERAL STORAGE AND USE RECOMMENDATIONS:

1. Purified Undiluted Standards.

Place in a container with desiccant and store in a freezer.

2. Concentrated "Stock" Solutions^{1,2}

- a. Store in a freezer.
- b. Replace stable compounds such as organochlorines and triazines after one year.
- c. Replace compounds that degrade only at ambient temperature after six months. Compounds specifically identified as requiring replacement after 6 months include carbaryl, carbofuran, methiocarb, ametryn, atraton, atrazine, prometon, and prometryn.

(1) Hodgson, D.W., and Watts, R. R., Accuracy of Pesticide Reference Standard Solutions: Part I, Factors Affecting Organic Solvent Evaporation, submitted to the JAOAC.

(2) Hodgson, D. W., Thompson, J. F., and Watts, R. R., Accuracy of Pesticide Reference Standard Solutions: Part II, Chemical Stability Under Four Storage Conditions, submitted to the JAOAC.

- d. Monthly replacement is recommended for the following unstable compounds: butylate, CDEC, and disulfoton. Other compounds not tested but likely to fall in this class include vernolate, pebulate, etc.
3. Dilute "Working" Solutions^{1,2} (See Footnotes on previous page)
- a. Store stable compounds in a refrigerator if not in daily use and reprepare by dilution of "stock" solution after six months. Replace sooner if solvent loss is evident.
 - b. Stable solutions kept on lab benches should be replaced with fresh dilutions of "stock" after three months or with unopened standards from freezer storage (C,3,b). Replace sooner if solvent loss is evident.
 - c. Compounds known to be unstable at ambient temperatures (E,2,c) should be stored in a refrigerator between uses and replaced with fresh "stock" dilutions every two months. Replace sooner if solvent loss is evident.
 - d. Unstable compounds (E,2,d) should be stored in a refrigerator between uses and replaced with fresh "stock" dilutions every week.

Section V

DECODING RESIDUE ANALYTICAL METHOD REFERENCES

Six residue method references for each compound are cited if this number could be located. Those cited do not necessarily represent the complete bibliography for any given compound. Where there were ample bibliography, methods for various types of media are cited. With a few exceptions, references are restricted to publications within the past ten years. There is no intention to endorse or recommend any cited methodology. They are represented purely as an aid to the analyst in the search for candidate methodology to resolve an analytical task.

To conserve space, the references are presented in code, each citation in a series of six blanks under capital letter headings of A through F in the tables wherein all available reference standard compounds are listed. The decoding key is given in the following:

<u>A</u>	<u>B</u>	<u>C</u>	<u>D</u>	<u>E</u>	<u>F</u>

ILLUSTRATION OF USE OF THE KEY

Referring to the compound, Acephate, we note a total of three references. Taking the first reference for illustration, we see

<u>A</u>	<u>B</u>	<u>C</u>	<u>D</u>	<u>E</u>	<u>F</u>
AL	74	57	189	c	cde

Reference to the journal list shows that the AL under A refers to the Journal of the Association of Official Analytical Chemists; the number 74 under B shows the publication year to be 1974; the 57 under C is the volume number of the journal; the 189 under D is the starting page of the journal publication; the c under E indicates that the determinative instrumentation was gas-liquid chromatography with a flame ionization detector; and the cde under F indicates that the author conducted his research on cereal, grain, vegetable and fruit crops.

Chemical manufacturers have in many instances developed methods which are available by writing them. These company-developed methods are referenced in the coding under the A heading by a single digit and a capital letter. This code identifies the company in Section VI. For example, the symbol 1E appearing under the heading A identifies Amchem Products, Inc. as the method source; the symbol 3Z refers to Gulf Oil Chemical, and so on. In these company method citations, data under B, C, and D headings are omitted as they are inapplicable.

Section VII

INDEX OF PESTICIDE EQUIVALENT NAMES

The list of more than 4,000 pesticide names in the following pages will assist the reader in tracking down the official or common names of a wide variety of pesticides when the only names available are of proprietary or trade origin.

Each page of the compendium consists of two columns of pesticide names. The column on the left lists the pesticide names, including "common" as well as proprietary or trade names, in alphabetical order. The center column lists the common name if any has been assigned at the time of this edition. On the right a stock code number appears if the compound is available from our repository.

Common names are established by long usage, by the American National Standards Institute (ANSI), the International Standards Organization (ISO), or by other organizations. When there is no common name, a proprietary name is used in this table rather than a complex chemical name. However, the nomenclature of pesticides is constantly changing, new common names are being established, and even the precise chemical names used by Chemical Abstracts are changed to meet new standards of nomenclature. Although some trade names may be convenient, unfortunately, they are not suitable for regulatory and legal purposes. The reader should be aware that during the life of this edition many compounds known currently only by trade names will be assigned common names.

PESTICIDE EQUIVALENT NAMES

NAME	COMMON NAME	CODE NUMBER	NAME	COMMON NAME	CODE NUMBER
Aaterra	Ethazol	6590	Agrisil	Trichloronate	
Aatrex	Atreazine	0420	Agristrep	Streptomycin sulfate	6222
Abar	Leptophos	4190	Agritol	Bacillus thuringiensis	
Abate	Temephos	0020	Agritox	Trichloronate	6783
Abathion	Temephos	0020	Agrosan	PMMA	5680
Abstensil	Disulfiram		Agrotec	2,4-D	2940
Abstynil	Disulfiram		Agrothion	Fenitrothion	3480
AC 528	Dioxathion	2580	Agrox	Phenylmercury urea	
AC-4124	Dicaphon		Agroxon	MCPA	
AC-12880	Dimethoate	2420	Aqualine	Acrolein	0027
AC-18682	Prothoate		Akar	Chlorobenzilate	1360
AC-26691	Cythoate	1621	Akton	Akton	
AC-47031	Phosfolan	1610	Alachlor	Alachlor	4160
AC-52160	Temephos	0020	Alamos	Azothoate	
AC-84777	Difenzoquat	2395	Alanap	Naptalam	4920
AC-92553	Penoxalin		Alar	Daminozide	
Acarben	Chlorobenzilate	1360	Albamylin	Novoblocin	
Acaralate	Chloropropylate		Aldicarb	Aldicarb	0060
Acarin	Dicofol	2340	Aldicarb sulfone	Aldicarb sulfone	0062
Acarol	Bromopropylate		Aldicarb sulfoxide	Aldicarb sulfoxide	0061
Acaron	Chlordimeform	1480	Aldrin	Aldrin	0080
Accelerate	Endothall	3240	Aldrite 4	Aldrin	0080
Accothion	Fenitrothion	3480	Aldrosol	Aldrin	0080
Acephate	Acephate	0025	Alfacron	Iodofenphos	
Acetaphos	Acetophos		Alfa-tox	Methoxychlor & Diazinon	4541, 2080
Acethion	Acethion		Alipur	Cycluron & Chlorbufam	
Acetochlor	Acetochlor		Alipur-O	Cycluron	
Acetophos	Acetophos		Alkron	Parathion ethyl	5245
Acetoxon	Acetoxon		Allantoin	Allantoin	
Acifluorfen	Blazer R	0760	Alleron	Parathion ethyl	5245
Acracid	Binapacryl		Allethrin	Allethrin	0100
Acricid	Binapacryl		Allidochlor	CDAA	1140
Acrizane	Phenacridone chloride		Allisan	Dichloran	2260
Acrolein	Acrolein	0027	Alltox	Toxaphene	6740
Acronize	Chlortetracycline		Allyveratrole	Methyl eugenol	
Acrylaldehyde	Acrolein		Allyxycarb	Allyxycarb	
Actamer	Bithionol		Alon	Isoproturon	
Actellic	Pirimphos-methyl	5643	Alodan	Alodan	
Acti-Aid	Cycloheximide	1600	Alorac	Alorac	
Actidione	Cycloheximide	1600	Alopex	Clofop-Isobutyl	1530
Actispray	Cycloheximide	1600	Altoric	Triprene	
Activol	Gibberellic acid	3790	Altosid	Methoprene	4531
Actril	Toxynil	4040	Altosar	Hydroprene	
Adamsite	Phenarsazone chloride		Ambox	Binapacryl	
Aerotherm TT	Trichloroethane		Ambush	Permethrin	5373
Afalon	Linuron	4240	Ancide	AHS	
Afesin	Monolinuron	4751	Anerol	Anitrole	0200
AFL-1082	Fluoroacetoneilide		Amethopterin	Methotrexate	
Aflix	Formothion	3722	Ametrex	Ametryn	0120
Afnor	Chlorophacinone	1425	Ametryn	Ametryn	0120
Afos	Heclabam	4441	Amex 820	Butralin	0933
Afugan	Pyrazophos	5932	Amiben	Chloramben	0140
Agallol	HEMC		Amidithion	Amidithion	
Agriamycin	Streptomycin Sulfate	6222			

PESTICIDE EQUIVALENT NAMES

NAME	COMMON NAME	CODE NUMBER	NAME	COMMON NAME	CODE NUMBER

Section VIII

MAILING LIST CONFIRMATION

This copy of the 1980 revision of our reference standards index was mailed to the address appearing on our mailing list and only to those facilities who have either (1) requested standards within a 2-year period, or (2) signified by returning the form below which accompanied our 1978 edition. Undoubtedly some addresses or names of facilities have changed or in some cases have ceased to exist.

If you wish to remain on our mailing list to receive future updates of this publication, please complete the mailback below the dashed line in full, snip the mailback off with a pair of scissors, and return it to us. Slips reaching us with a signature alone without full name and address of facility will be discarded. If you have no present use for this publication but know of some other individual within your organization who is concerned with pesticides or environmental analysis, would you please relay this index to that individual.

DO NOT RETURN THIS ENTIRE PAGE - ONLY THE PORTION BELOW THE DASHED LINE.

To: U. S. Environmental Protection Agency
Health Effects Research Laboratory (MD-69)
Environmental Toxicology Division
Research Triangle Park, NC, U.S.A. 27711

_____ Date

- ☐ We wish to be retained on your mailing list to receive future updates of the Pesticides Standards Index. The address shown on the envelope is entirely correct and requires no changes.
- ☐ We have no interest in future updates of this publication. Please cancel us from your mailing list.
- ☐ We wish to be retained on your mailing list, but the address shown on the envelope should be changed to read (print or type).

_____ Recipient

Section IX

AVAILABILITY OF ANALYTICAL REFERENCE STANDARDS

Reference standards are intended for the use of laboratories in the following categories: state and municipal, U.S. Federal Government, foreign government, and college and university. Instructions for ordering standards are given on p. 2 (Section I,a).

Private laboratories are also eligible to receive standards if they have a government contract (federal, state, or local) which necessitates the use of these materials. If you, as a private laboratory requester, are ordering standards, and your company does have such a contract or sub-contract, complete the questionnaire below the dashed line in full and return it to us with your first request. •

TO: Quality Assurance Section
EPA, HERL, ETD, ACB (MD-69)
Research Triangle Park, NC 27711

I hereby declare that our company has a contract with a U.S. government facility (federal, state, or local) which necessitates the use of analytical reference standard materials. Herewith are the pertinent data concerning the contract(s):

Title(s) of Contract Project(s):

Contract Number(s):

Name and Location of Government Project Officer:

Effective Date(s) of Start of Contract(s):

Projected Date(s) for Completion of Contract(s):

Company Name _____

Signature(s) of Contract(s) _____

Principal Investigator(s) _____
